```
Question 1
Correct
Mark 10.00 out of 10.00
```

We define super digit of an integer  $m{x}$  using the following rules:

Given an integer, we need to find the super digit of the integer.

- If  $\boldsymbol{x}$  has only  $\boldsymbol{1}$  digit, then its super digit is  $\boldsymbol{x}$ .
- Otherwise, the super digit of  $m{x}$  is equal to the super digit of the sum of the digits of  $m{x}$ .

For example, the super digit of **9875** will be calculated as:

```
super_digit(9875) 9+8+7+5 = 29
super_digit(29) 2 + 9 = 11
super_digit(11) 1 + 1 = 2
super_digit(2) = 2
```

## **Example**

```
n = 9875'
k = 4
```

The number p is created by concatenating the string n k times so the initial p = 9875987598759875.

All of the digits of p sum to 116. The digits of 116 sum to 8. 8 is only one digit, so it is the super digit.

#### **Function Description**

Complete the function superDigit in the editor below. It must return the calculated super digit as an integer.

superDigit has the following parameter(s):

- string n: a string representation of an integer
- int k: the times to concatenate n to make p

#### Returns

int: the super digit of n repeated k times

## Input Format

The first line contains two space separated integers,  ${\it n}$  and  ${\it k}$ .

#### **Constraints**

- $1 \le n < 10^{100000}$
- $1 \le k \le 10^5$

# Sample Input 0

```
148 3
```

## Sample Output 0

```
3
```

# Explanation 0

```
Here n=148 and k=3, so p=148148148.
```

## Sample Input 1

```
9875 4
```

## Sample Output 1

```
8
```

## Sample Input 2

```
123 3
```

## Sample Output 2

```
9
```

## **Explanation 2**

```
Here n=123 and k=3, so p=123123123.
```

#### For example:

Input	Result		
148 3	3		
9875 4	8		
123 3	9		

## Answer: (penalty regime: 0 %)

## Reset answer

Correct

Marks for this submission: 10.00/10.00.

#### Ouestion 2

Correct

Mark 10.00 out of 10.00

Find the number of ways that a given integer, X, can be expressed as the sum of the  $N^{th}$  powers of unique, natural numbers.

For example, if X=13 and N=2, we have to find all combinations of unique squares adding up to 13. The only solution is  $2^2+3^2$ .

#### **Function Description**

Complete the *powerSum* function in the editor below. It should return an integer that represents the number of possible combinations.

powerSum has the following parameter(s):

- X: the integer to sum to
- N: the integer power to raise numbers to

#### **Input Format**

The first line contains an integer X.

The second line contains an integer N.

#### **Constraints**

- $1 \le X \le 1000$
- $2 \le N \le 10$

#### **Output Format**

Output a single integer, the number of possible combinations caclulated.

## Sample Input 0

10

## Sample Output 0

1

#### **Explanation 0**

If X = 10 and N = 2, we need to find the number of ways that 10 can be represented as the sum of squares of unique numbers.

$$10 = 1^2 + 3^2$$

This is the only way in which 10 can be expressed as the sum of unique squares.

#### Sample Input 1

100

## Sample Output 1

3

#### Explanation 1

$$100 = (10^2) = (6^2 + 8^2) = (1^2 + 3^2 + 4^2 + 5^2 + 7^2)$$

# Sample Input 2

100

# 90

# Sample Output 2

1

#### **Explanation 2**

100 can be expressed as the sum of the cubes of 1, 2, 3, 4. (1+8+27+64=100). There is no other way to express 100 as the sum of cubes.

### For example:

Input	Result
10 2	1
100 2	3
100 3	1

Answer: (penalty regime: 0 %)
